### Testing with one real parameter

#### Outline

- 1) One-sided tests in general
- 2) Two-sided tests
- 3) UMP unbinsed tests

## One-sided tests in general

Ho: 
$$\theta \leq \theta_0$$
 us  $H_1: \Theta > \theta_0$  called one-sided hypothesis

If a large, could prioritize 
$$\theta_1 = \theta_0 + \epsilon_5$$
 & to

log 
$$LR(x) = log \frac{\rho_{0,+\epsilon}(x)}{\rho_{0,(x)}} \approx \epsilon \cdot \hat{L}(\theta_{0,+\epsilon}(x))$$

$$\Rightarrow$$
 Use score at  $\Theta_o$   $\mathcal{L}(\theta_o; X)$  as test state

$$\phi(x) = 19i(0:x) = 0$$

Need to check 
$$\beta_{\phi}(0) \leq \alpha$$
 for  $\theta \leq \theta_{o}$ 

$$\Theta_{i} = \Theta_{i}$$
:  $|O_{i}(P_{i}(x)/P_{i}(x))| = \sum_{i=1}^{n} |X_{i} - \Theta_{i}| - |X_{i} - \Theta_{i}|$ 

$$T(x) = \begin{cases}
\theta_0 - \theta_1 & x \leq \theta_0 \\
2x - \theta_0 - \theta_1 & \theta_0 \leq x \leq \theta_1 \\
\theta_1 - \theta_0 & x \geq \theta_1
\end{cases}$$

$$\frac{S_{core}}{\int_{c}^{c} \frac{1}{\sqrt{2\pi}} \left( \frac{\partial}{\partial s} \right) ds} = \frac{d}{d\theta} \left[ \frac{1}{\sqrt{2\pi}} - |X_i - \theta| \right]_{\theta = \theta_0}$$

$$= \frac{2}{\sqrt{2\pi}} \left[ \frac{1}{\sqrt{2\pi}} + \frac{1}{\sqrt{2\pi}} - \frac{1}{\sqrt{2\pi}} \right]_{\theta = \theta_0}$$

Equivalent: 
$$S(x) = \sum_{i=1}^{n} 18x_i \ge 0.3$$
 Sign test

# Stochastically incr.

Def A real-valued statistic T(x) is stochastically increasing in  $\Theta$  if  $P_{\Theta}(T(x) \le t)$  is non-incr. in  $\theta$ ,  $\forall t$ 

If  $\phi(x)$  rejects for large T(x):  $\phi(x) = 1\{T(x) > c\} + \gamma 1\{T(x) = c\}$ 

and T(X) is stochastically increasing in  $\Theta$ ,  $E_{\Theta}(X) = (1-\gamma)P_{\Theta}(T>c) + \gamma P_{\Theta}(T>c) - N_{in}\Theta$ 

 $E_{x}$   $X_{i}$  iid  $p(x-\theta)$  (location family) T(x) = sample near, median, sign statistic

Ex X:  $\frac{11d}{6} \rho(x_0)$  (scale family) T(x) =  $\sum x_i^2$  or median ( $1x_1,...,1x_n1$ )

### Two-sided Alternatives

Sety: 
$$\beta = \int_{0}^{\infty} \Theta \in \Theta \subseteq \mathbb{R}^{3}$$
,  $\Theta \in \Theta^{\circ}$   
Test  $H_{o}: \Theta = \Theta_{o}$  vs.  $H_{i}: \Theta \neq \Theta_{o}$   
(Can be generalized naturally to  $H_{o}: \Theta \in [0, 0, 0, 1]$ )

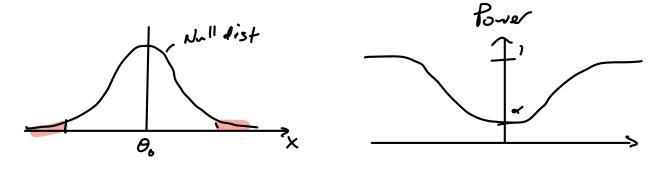

Two-tailed test rejects when T(X) is "extreme"

$$\phi(x) = \begin{cases} 1 & T(x) < c_1 \\ 0 & T(x) \in (c_1, c_2) \\ \gamma_i & T(x) = c_i \end{cases}$$

Two ways to reject. How to balance?

For symmetric distributions like N(0,1),
natural choice is to equalize "lobes" of rej. region

$$\phi_2(x) = 1\{|x-\theta_0| > 2\alpha/2\}$$
 for  $H_0: \theta = \theta_0$ 

For asymmetric dists, or interval null Hi: Ø ([0,,0]),
more complicated

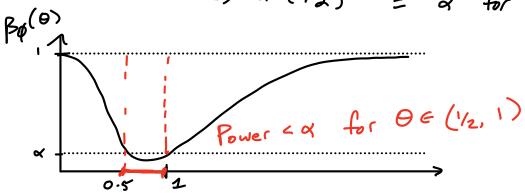

#### Equal-tailed & unbiased tests

Valid if 
$$\alpha_1 + \alpha_2 = \alpha$$
 ( $\alpha_1$  is "free paremeter")

$$E_X \quad X \sim E_X \rho(0)$$
, test  $H_0: \theta = 1$ 

Solve for cutoffs: 
$$\frac{\alpha}{2} = P_1(x \le c_1) = 1 - e^{-c_1} \Rightarrow c_1 = -\log(1-\frac{\pi}{2})$$

$$1 - \frac{\alpha}{2} = 1 - e^{-c_2} \Rightarrow c_2 = -\log(\frac{\alpha}{2})$$

# Unbiased tests

Def 
$$\phi(x)$$
 is unbiased if  $\inf_{\Theta \in \Theta} F_{\Theta} \phi(x) \ge d$ 

$$\beta \phi(\theta_0) = \alpha$$
 (2 equations, "2" unknowns)  $\frac{d\beta}{d\theta}(\theta_0) = 0$ 

$$\beta_{\phi}(\Theta)$$
 $\Theta$ 
 $\Theta$ 
 $\Theta$ 

$$X \sim e^{2^{T(x)}-A(2)}h(x)$$
 (MLR in T(X))

Assume T(X) continuous, solve

$$O = \frac{d\beta_{\delta}}{d\gamma}(\gamma_{\delta}) = Cov_{\delta}(\phi(T), T)$$

= 
$$\mathbb{E}_{\eta_0}[(\phi(\tau)-\alpha)T(x)]$$

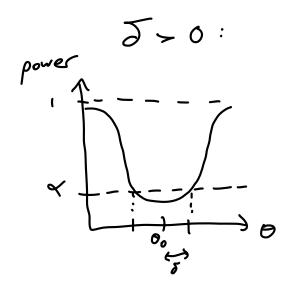

Theorem Assume  $X \sim e^{\Theta T(X) - A(2)} h(x)$   $H_0: |\theta - \theta_0| \le \delta$  vs  $H_1: |\theta - \theta_0| > \delta$ ,  $\delta \ge 0$ Let  $\phi^*$  be test that rejects for extreme T(X), with  $c_1, c_2, \gamma_1, \gamma_2$  chosen so:

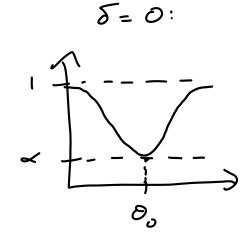

(i)  $\mathcal{B}_{\phi^*}(\theta + \delta) = \mathcal{B}_{\phi^*}(\theta - \delta) = \alpha$ 

(i)  $\beta_{\phi*}(\theta+\delta) = \beta_{\phi*}(\theta-\delta) = \alpha$ and, if  $\delta=0$  (point null)

(ii)  $0 = \beta_{\phi*}(\theta_0) = \mathbb{E}_{\theta}[(T-\mathbb{E}_{\delta}T)\phi(x)]$ 

Then of is UMPU

Proof: Assume who 
$$\Theta_0 = 0$$

( $\delta = 0$ ):

Want to solve

Maximize  $\int \rho \rho dM$ 

S.t.  $\int \rho \rho dM = 0$ 

Lagrange form:

Max  $\int \rho \left(\rho_0 - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dM$ 

=  $\int \phi \left(\frac{\rho_0}{\rho_0} - \lambda_1 - \lambda_2 (T - E_0 T)\right) dN$ 

=  $\int \phi \left(\frac{\rho_0}{\rho_0} - \lambda_1 - \lambda_2 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 
 $\partial P \left(P - \lambda_1 \rho_0 - \lambda_2 \rho_0 (T - E_0 T)\right) dP$ 

Suppose \$,\$\* satisfy constraints,

\$\phi \text{maximizes Lagrangien for \$\lambda\_1, \$\lambda\_2\$

$$\beta_{\beta}(0,) = \beta_{\beta}(0,) + \lambda_{1}(\beta_{\delta}(0) - \alpha) + \lambda_{2} \beta_{\delta}(0) + \lambda_{1}(\beta_{\delta}(0) - \alpha) + \lambda_{2} \beta_{\delta}(0) + \lambda_{1}(\beta_{\delta}(0) - \alpha) + \lambda_{2} \beta_{\delta}(0) + \lambda_{2} \beta_{\delta}(0) + \lambda_{2} \beta_{\delta}(0)$$

$$= \beta_{\delta}(0,)$$

$$(5>0) \max \int \phi \rho_0 d\mu$$
s.t. 
$$\int \phi \rho_5 d\mu = \int \phi \rho_{-5} d\mu = \chi$$

Lagrangian:

$$\int \phi \left( \rho_{0} - \lambda_{1} \rho_{3} - \lambda_{2} \rho_{-3} \right) d\mu$$

$$= \int \phi \left( \varsigma_{e}^{0,T} - \varsigma_{2}^{\delta T} - \varsigma_{3}^{-\delta T} \right) d\rho$$

$$= \int \phi \left( \varsigma_{e}^{0,T} - \varsigma_{2}^{\delta T} - \varsigma_{3}^{-\delta T} \right) d\rho$$

$$\theta_{1} > \delta$$
:

Reject for  $c_{1}e^{(\theta_{1}-\delta)T(x)}$  -25T(x)

$$e^{(\theta_{1}-\delta)T}$$

$$c_{2}+c_{3}e^{(\theta_{1}-\delta)T}$$

$$c_{3}+c_{4}e^{(\theta_{1}-\delta)T}$$

$$c_{4}+c_{5}e^{(\theta_{1}-\delta)T}$$

Rest of proof same as 5=0
